List of Figures

1.1	Cartoon of Thomas Bayes with Bayes' theorem in background. Source: [James Kulich](https://www.elmhurst.edu/blog/thomas-bayes/)	6
1.2	Binomial likelihood with $n = 57$ released animals and $y = 19$ survivors after winter. The value of survival (on the x-axis) that corresponds to the maximum of the likelihood function (on the y-axis) is the MLE, or the proportion of success in this example, close to 0.33.	11
1.3	Winter survival posterior distribution obtained by numerical integration.	12
1.4	The distribution $\text{beta}(a,b)$ for different values of a and b . Note that for $a = b = 1$, we get the uniform distribution between 0 and 1 in the top left panel. When a and b are equal, the distribution is symmetric, and the bigger a and b , the more peaked the distribution or the smaller the variance.	13
1.5	MCMC article cover. Source: [The Journal of Chemical Physics](https://aip.scitation.org/doi/10.1063/1.1699114)	15
1.6	Visualisation of a Markov chain starting at value 0.5, with steps or iterations on the x-axis, and samples on the y-axis. This graphical representation is called a trace plot.	22
1.7	Trace plot of survival for two chains starting at 0.2 (yellow) and 0.5 (blue) run for 100 steps.	22

1.8	Trace plot of survival for a chain starting at 0.5 and 1000 steps.	22
1.9	Animated trace plot of survival with three chains starting at 0.2, 0.5 and 0.7 run for 1000 steps.	23
1.10	Determining the length of the burn-in period. The chain starts at value 0.99 and rapidly stabilises, with values bouncing back and forth around 0.3 from the 100th iteration onwards. You may choose the shaded area as the burn-in, and discard the corresponding values.	24
1.11	Brooks-Gelman-Rubin statistic as a function of the number of iterations.	24
1.12	Trace plots for different values of the standard deviation (SD) of the proposal distribution. Left: The chain exhibits small moves and mixing is bad. Right: The chain exhibits big moves and mixing is bad. Middle: The chain exhibits adequate moves and mixing is good. Only the thousand last iterations are shown.	25
1.13	Autocorrelation function plots for different values of the standard deviation (SD) of the proposal distribution. Left and right: Autocorrelation is strong, decreases slowly with increasing lag and mixing is bad. Middle: Autocorrelation is weak, decreases rapidly with increasing lag and mixing is good.	26

Welcome

Welcome to the online version of the book *Bayesian Analysis of Capture-Recapture Data with Hidden Markov Models – Theory and Case Studies in R*.

The HMM framework has gained much attention in the ecological literature over the last decade, and has been suggested as a general modelling framework for the demography of plant and animal populations. In particular, HMMs are increasingly used to analyse capture-recapture data and estimate key population parameters (e.g., survival, dispersal, recruitment or abundance) with applications in all fields of ecology.

In parallel, Bayesian statistics is well established and fast growing in ecology and related disciplines, because it resonates with scientific reasoning and allows accommodating uncertainty smoothly. The popularity of Bayesian statistics also comes from the availability of free pieces of software (WinBUGS, OpenBUGS, JAGS, Stan, NIMBLE) that allow practitioners to code their own analyses.

This book offers a Bayesian treatment of HMMs applied to capture-recapture data. You will learn to use the R package NIMBLE which is seen by many as the future of Bayesian statistical ecology to deal with complex models and/or big data. An important part of the book consists in case studies presented in a tutorial style to abide by the “learning by doing” philosophy.

I’m currently writing this book, and I welcome any feedback. You may raise an issue ¹, amend directly the R Markdown file that generated the page you’re reading by clicking on the ‘Edit this page’ icon in the right panel, or email me ². Many thanks!

Preface

Why this book?

To be completed. Why and what of capture-recapture data and models, with fields of application.⁵ Brief history of capture-recapture, with switch to state-space/hidden Markov model (HMM) formulation. Flexibility of HMM to decompose complex problems in smaller pieces that are easier to understand, model and analyse. From satellite guidance to conservation of endangered species. Why Bayes? Also three of my fav research topics – capture-recapture, HMM and Bayes statistics – let's enjoy this great cocktail together.

Who should read this book?

This book is aimed at beginners who're comfortable using R and write basic code (including loops), as well as connoisseurs of capture-recapture who'd like to tap into the power of the Bayesian side of statistics. For both audiences, thinking in the HMM framework will help you in confidently building models and make the most of your capture-recapture data.

⁵Watch out nice Johnny Ball's video <https://www.youtube.com/watch?v=tyX79mPm2xY>.

What will you learn?

The book is divided into five parts. The first part is aimed at getting you up-to-speed with Bayesian statistics, NIMBLE, and hidden Markov models. The second part will teach you all about capture-recapture models for open populations, with reproducible R code to ease the learning process. In the third part, we will focus on issues in inferring states (dealing with uncertainty in assignment, modelling waiting time distribution). The fourth part provides real-world case studies from the scientific literature that you can reproduce using material covered in previous chapters. These problems can either i) be used to cement and deepen your understanding of methods and models, ii) be adapted for your own purpose, or iii) serve as teaching projects. The fifth and last chapter closes the book with take-home messages and recommendations, a list of frequently asked questions and references cited in the book. **Likely to be amended after feedbacks.**

What won't you learn?

There is hardly any maths in this book. The equations I use are either simple enough to be understood without a background in maths, or can be skipped without prejudice. I do not cover Bayesian statistics or even hidden Markov models fully, I provide just what you need to work with capture-recapture data. If you are interested in knowing more about these topics, hopefully the section Suggested reading at the end of each chapter will put you in the right direction. There are also a number of important topics specific to capture-recapture that I do not cover, including closed-population capture-recapture models [?], and spatial capture-recapture models [?]. These models can be treated as HMMs, but for now the usual formulation is just fine. **There will be spatial considerations in the Covariates chapter w/ splines and CAR. I'm not sure yet about SCR models (R. Glennie's Biometrics paper on**

HMMs and open pop SCR will not be easy to Bayes transform and implement in NIMBLE).

Prerequisites

This book uses primarily the R package NIMBLE, so you need to install at least R and NIMBLE. A bunch of other R packages are used. You can install them all at once by running:

```
install.packages(c(
  "magick", "MCMCvis", "nimble", "pdftools",
  "tidyverse", "wesanderson"
))
```

Acknowledgements

To be completed.

How this book was written

I am writing this book in RStudio⁶ using bookdown⁷. The book website⁸ is hosted with GitHub Pages⁹, and automatically updated after every push by Github Actions¹⁰. The source is available from GitHub¹¹.

The version of the book you're reading was built with R version 4.1.0 (2021-05-18) and the following packages:

package	version	source
magick	2.7.3	CRAN (R 4.1.0)
MCMCvis	0.15.3	CRAN (R 4.1.0)
nimble	0.11.1	CRAN (R 4.1.0)
pdftools	3.0.1	CRAN (R 4.1.0)
tidyverse	1.3.1	CRAN (R 4.1.0)
wesanderson	0.3.6	CRAN (R 4.1.0)

About the author

My name is Olivier Gimenez (<https://oliviergimenez.github.io/>). I am a senior (euphemism for not so young anymore) scientist at the National Centre for Scientific Research (CNRS) in the beautiful city of Montpellier, France.

I struggled studying maths, obtained a PhD in applied statistics a long time ago in a galaxy of wine and cheese. I was awarded my habilitation (<https://en.wikipedia.org/wiki/Habilitation>) in ecology and evolution so that I could stop pretending to understand what my colleagues were talking about. More recently I embarked in sociology studies because hey, why not.

Lost somewhere at the interface of animal ecology, statistical modeling and social sciences, my so-called expertise lies in population dynamics and species distribution modeling to address questions in ecology and conservation biology about the impact of human activities and the management of large carnivores. I would be nothing without the students and colleagues who are kind enough to bear with me.

You may find me on Twitter (<https://twitter.com/oaggimenez>), GitHub (<https://github.com/oliviergimenez>), or get in touch by email¹².

Part I

I. Foundations

Introduction

1

Bayesian statistics & MCMC

Add visual explanation of credible intervals, plus histogram and density plot for posterior distribution

1.1 Introduction

In this first chapter, you will learn what the Bayesian theory is, and how you may use it with a simple example. You will also see how to implement simulation algorithms to implement the Bayesian method for more complex analyses. This is not an exhaustive treatment of Bayesian statistics, but you should get what you need to navigate through the rest of the book.

1.2 Bayes' theorem

Let's not wait any longer and jump into it. Bayesian statistics relies on the Bayes' theorem (or law, or rule, whatever you prefer) named after Reverend Thomas Bayes (Figure 1.1). This theorem was published in 1763 two years after Bayes' death thanks to his friend's efforts Richard Price, and was independently discovered by Pierre-Simon Laplace [?].

As we will see in a minute, Bayes' theorem is all about conditional probabilities, which are somehow tricky to understand. Conditional probability of outcome or event A given event B , which we denote $\Pr(A \mid B)$, is the probability that A occurs, revised by considering the additional

FIGURE 1.1: Cartoon of Thomas Bayes with Bayes' theorem in background. Source: [James Kulich](<https://www.elmhurst.edu/blog/thomas-bayes/>)

information that event B has occurred.¹ The order in which A and B appear is important, make sure you do not confuse $\Pr(A \mid B)$ and $\Pr(B \mid A)$.

Bayes' theorem (Figure 1.2) gives you $\Pr(A \mid B)$ using marginal probabilities $\Pr(A)$ and $\Pr(B)$ and $\Pr(B \mid A)$:

$$\Pr(A \mid B) = \frac{\Pr(B \mid A) \Pr(A)}{\Pr(B)}.$$

Originally, Bayes' theorem was seen as a way to infer an unknown cause A of a particular effect B, knowing the probability of effect B given cause A. Think for example of a situation where a medical diagnosis is needed, with A an unknown disease and B symptoms, the doctor knows $P(\text{symptoms} \mid \text{disease})$ and wants to derive $P(\text{disease} \mid \text{symptoms})$. This way of reversing $\Pr(B \mid A)$ into $\Pr(A \mid B)$ explains why Bayesian thinking used to be referred to as 'inverse probability'.

¹For example, a friend of yours rolls a fair dice and asks you the probability that the outcome was a six (event A). Your answer is 1/6 because each side of the dice is equally likely to come up. Now imagine that you're told the number rolled was even (event B) before you answer your friend's question. Because there are only three even numbers, one of which is six, you may revise your answer for the probability that a six was rolled from 1/6 to $\Pr(A \mid B) = 1/3$.
